## **TEST REPORT**

Testing of 50 Hz electric field absorption by  
NoEM Electro Protektor shielding coats  
(supersedes Test Report version of 12/01/2016)

**Customer:** Selena FM S.A.  
ul. Strzegomska 2-4  
53-611 Wrocław, Poland

**Order:** dated 13/11/2015

**Authors:** Hubert Śmietanka, MSc Eng.  
Agnieszka Wielonek, MSc Eng.

MANAGER

of the Environmental Impact & Overvoltage Protection Laboratory  
Piotr Papliński, MSc Eng.

**Warsaw, 15 January 2016**

## 1. Test objective

The test objective was to evaluate the absorption of a 50 Hz electrical field by the NoEM Electro Protektor shielding coat system, comprising of a paint coat primer and construction-grade plastic material, supplied by Selena FM S.A.

## 2. Performance method

No regulations or standards currently exist that establish the method for the determination of absorption of 50 Hz electric fields.

The reference know-how was derived from the IEEE Standard 299-2006, Method for Measuring the Effectiveness of Electromagnetic Shielding Enclosures.

This standard applies to the measurement of the effectiveness of absorption exhibited by electromagnetic shielding enclosures within the field frequency range between 9 kHz to 18 GHz (expandable to 50 Hz and 100 GHz).

## 3. Instruments

The test instruments were an existing test bench for calibration and verification of 50 Hz electric field meters. The test bench comprises of:

- a power supply system, type ABK-63C (an autotransformer with an integrated digital multimeter);
- a reference capacitor.

The instruments are permanently installed in Room 210 of the testing laboratory. The test bench overview is shown in image 1 and fig. 1.

Image 1. Test bench for 50 Hz electric field meters

Fig. 1. 50 Hz electrical field test system

The reference capacitor plate to plate distance is  $d = 0.5$  m. The 50 Hz electric field strength on the test bench relative to the capacitor plate voltage is expressed by the following relationship:

$$E \left[ \frac{V}{m} \right] = \frac{U[V]}{d[m]}$$

To test the absorption performance of the investigated shielding coats, special cubic structures were built as follows: for test Materials 1 to 4 – cubes of “Botament” boards were made and coated with 2 mm of gypsum plaster; for test Materials 5 to 7 – cubic openwork cages were made.

Inside each cube and cage a Maschek ESM-100 electric and magnetic field meter was located, the output of which was acquired via PC computer and an optical fibre link.

Image 2. View of the test setup with Maschek ESM-100 meter for testing of electrical field absorption during the test on the tester bench (Test Material 6, cage covered by construction-grade material, interior view)

Table 1. Field meter specifications

|                                 |  |
|---------------------------------|--|
| <b>Meter:</b>                   | <i>ESM-100, P/N 972071-001</i>   |
| <b>Manufacturer:</b>            | <i>Maschek Elektronik</i>  |
| <b>Frequency range:</b>         | <i>50 Hz (filter), 5 Hz to 400 kHz</i>   |
| <b>Measurement range:</b>       | <i>0.1 V/m to 100 kV/m (50 Hz filter) as shown in the meter manual<br/>0.01 kV/m to 20 kV/m (50 Hz filter) as shown on the calibration certificate</i> |
| <b>Calibration certificate:</b> | <i>Ref. no. 3703.1-M43-4180-458/14<br/>Issued by the Central Office of Measures, valid through 13/10/2016</i>  |

The testing involved a series of strength measurements of a 50 Hz electric field inside a flat capacitor system generating a reference field of a known value and in different variants to account for the shielding coat layers on individual walls of the cube and the cage framework and for the effects of humidity.

The test material absorption was determined by the relationship:

$$S_E = 20 \log_{10} \frac{E_1}{E_2} \text{ [dB]}$$

where:

$E_1$ - Reference strength of the 50 Hz electric field [kV/m] ( $E_w$ )

$E_2$ - Measured strength of the 50 Hz electric field [kV/m] ( $E_p$ )

The Test Materials are as shown in the table:

| Item | Sample code | Material type  |
|------|-------------|--|
| 1    | A           | Control, not painted   |
| 2    | B           | NoEM Electro Protektor, 4in1 Electric field shield, White paint coat, Antistatic coat, Priming base coat: 1 layer                            |
| 3    | C           | NoEM Electro Protektor, 4in1 Electric field shield, White paint coat, Antistatic coat, Priming base coat: 2 layers                           |
| 4    | D           | NoEM Electro Protektor, 4in1 Electric field shield, White paint coat, Antistatic coat, Priming base coat: 1 layer, sealed with an opaque top |
| 5    | E           | NoEM Electro Protektor, CEAQION TEX: white textile   |
| 6    | F           | NoEM Electro Protektor, 2in1 Electric field shield, Vapour barrier foil: yellow plastic film   |
| 7    | G           | NoEM Electro Protektor, 3in1 Electric field shield, Vapour barrier film, 3-ply foil: green plastic film                                      |

#### 4. Environmental conditions

**Table 2. Environmental conditions during measurements**

| Date       | Time           | Environmental conditions: |          |
|------------|----------------|---------------------------|----------|
|            |                | Temperature [°C]          | RH [%]   |
| 13/11/2015 | 12:00 to 14:30 | 22.2 to 23.6              | 43 to 62 |
| 17/12/2015 | 9:30 to 11:30  | 23.1 to 23.4              | 39 to 61 |

#### 5. Results

The measurement results are shown in tables below:

The test results are shown as a function of electrical field absorption dependent on:

- test material for the pre-set RH at 40, 50 and 60 %;
- RH for test materials A, B, C, D, E, F and G.

**Table 3. 50 Hz electric field absorption for test materials and RH 40%**

## **6. Evaluation conclusion**

**Given the results produced by measuring of the 50 Hz electric field strength and the calculated absorption performance of the NoEM Electro Protector materials, it was found that the absorption performance within the tested range of electric field strength is highest for the Test Materials E, F and G and the priming base coat layers in Test Material C.**

**The absorption performance parameters are better with higher RH, with the exception of the NoEM Electro Protector, 3in1 Electric field shield, Vapour barrier film, 3-ply foil: green plastic foil, which displays virtually constant absorption parameters, since this shielding material is covered with vapour barrier foils on both sides.**

**For the absorption performance of the NoEM Electro Protector, 2in1 Electric field shield, Vapour barrier foil - yellow plastic foil, absorption effectiveness differs when the exposure to the RH is done from the vapour breathing foil side.**

**The laminate features the shielding material covered with vapour barrier film on one side and with the vapour breathing film on the other.**

**The absorption performance of surfaces covered with the priming base coat shows small differences between RH 40% and RH 50%; however, increasing RH to 60% greatly improves the absorption performance.**

**The tests were made with the electrical field strength above 400 V/m; but take into account, that the absorption performance of the test materials will be comparable or higher at lower electric field strength values.**
